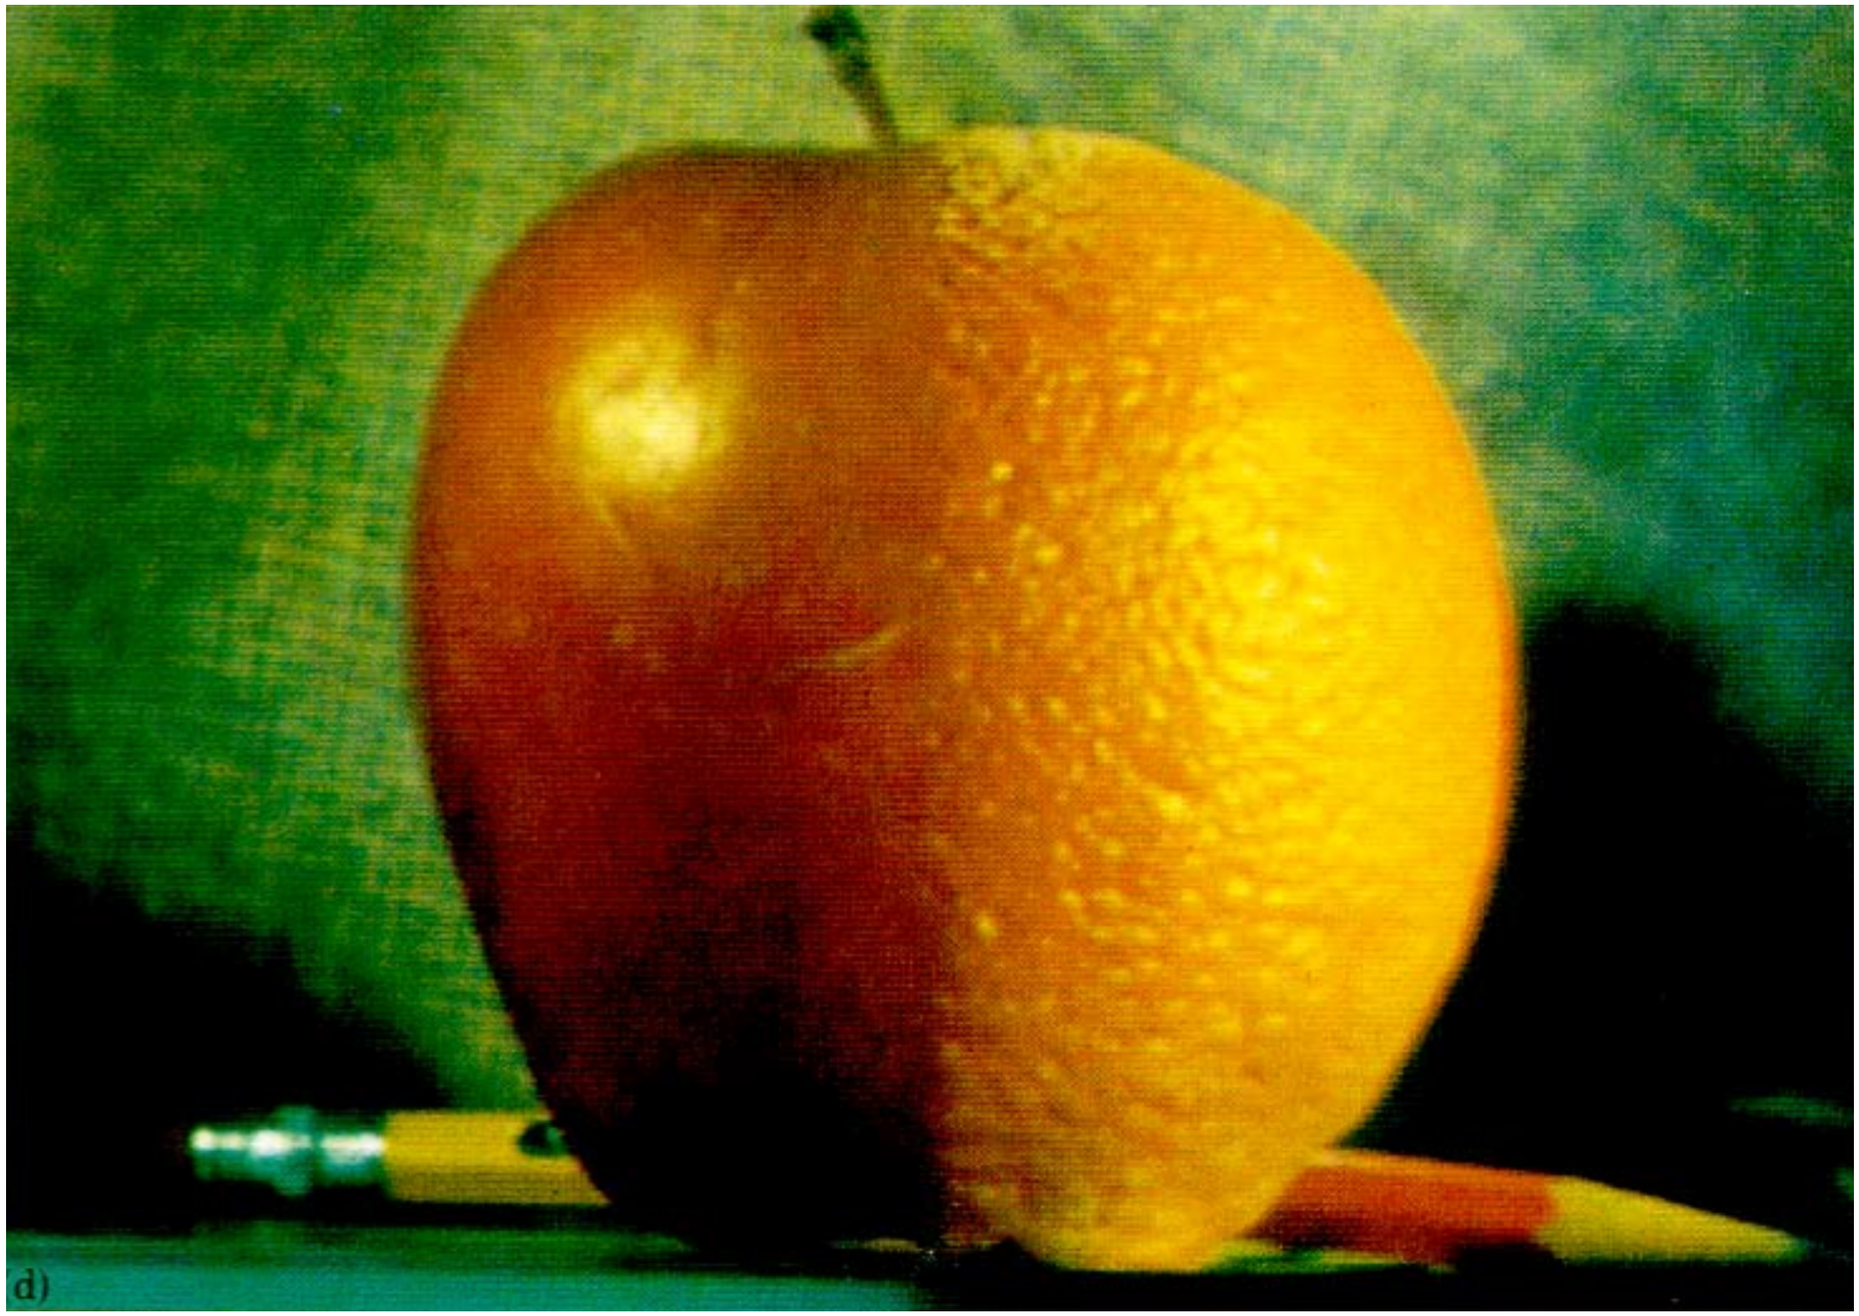
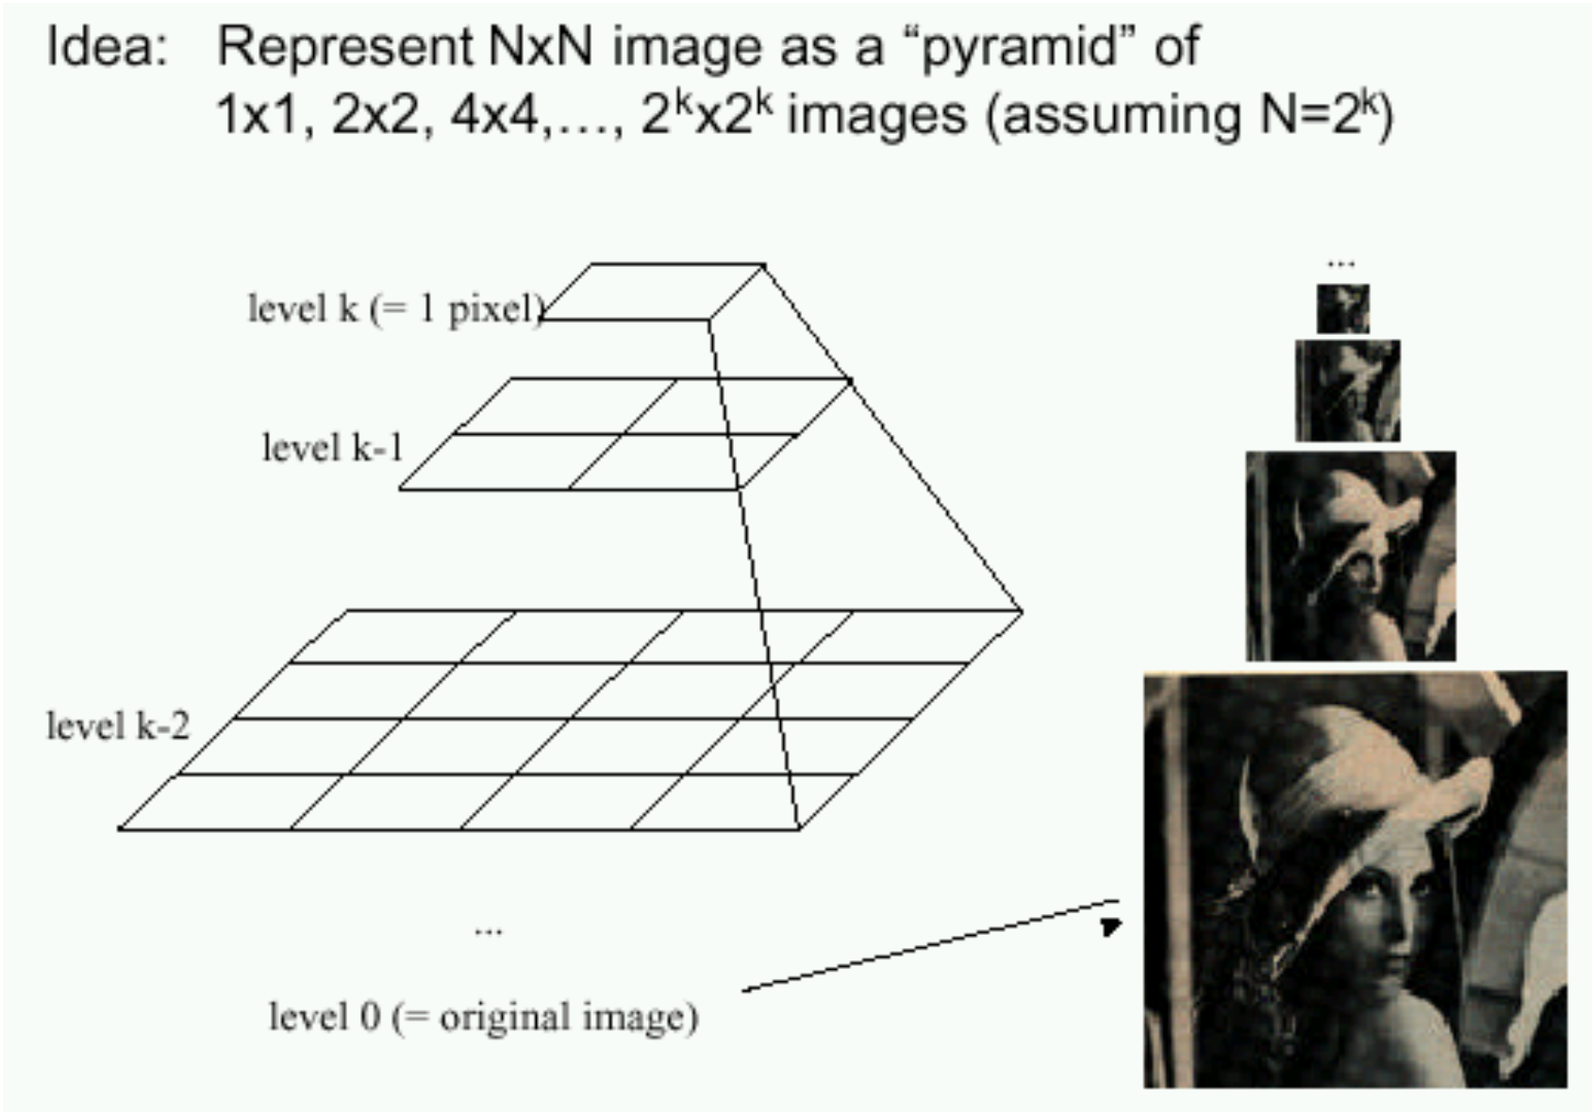
3D Reconstruction with Computer Vision
Meeting 6: Image Blending



Slides by Alexei Efros and others

CS 378 Fall 2014, UT Austin, Bryan Klingner, 11 September

Image Pyramids



Known as a **Gaussian Pyramid** [Burt and Adelson, 1983]

- In computer graphics, a *mip map* [Williams, 1983]
- A precursor to *wavelet transform*

512 256 128 64 32 16 8

A bar in the big images is a hair on the zebra's nose; in smaller images, a stripe; in the smallest, the animal's nose

Figure from David Forsyth

What are they good for?

Improve Search

- Search over translations
  - Classic coarse-to-fine strategy
- Search over scale
  - Template matching
  - E.g. find a face at different scales

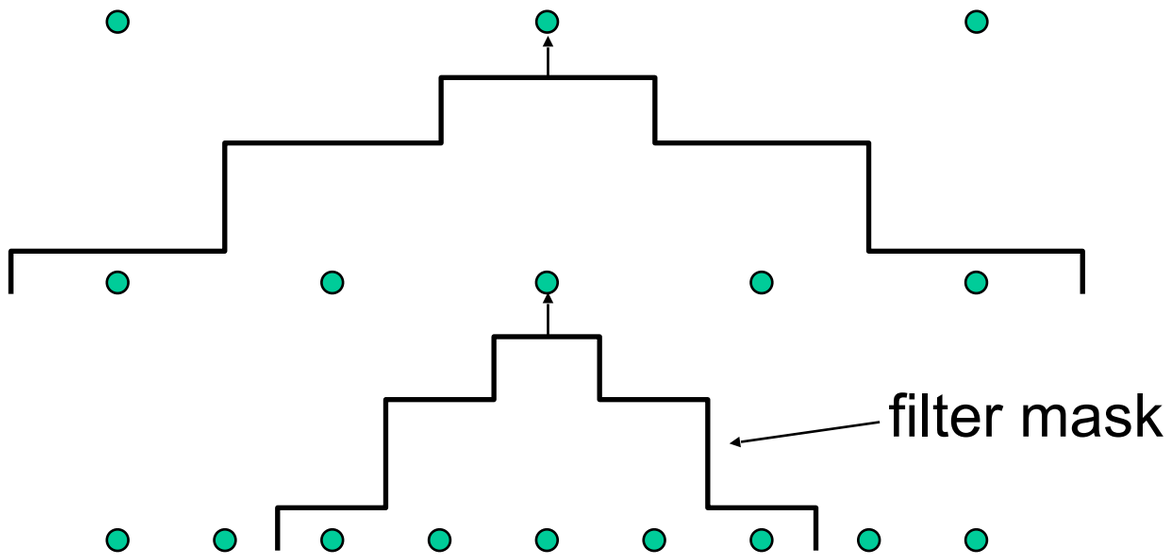
Pre computation

- Need to access image at different blur levels
- Useful for texture mapping at different resolutions (called mip-mapping)

Image Processing

- Editing frequency bands separately
- E.g. image blending…

Gaussian pyramid construction



Repeat

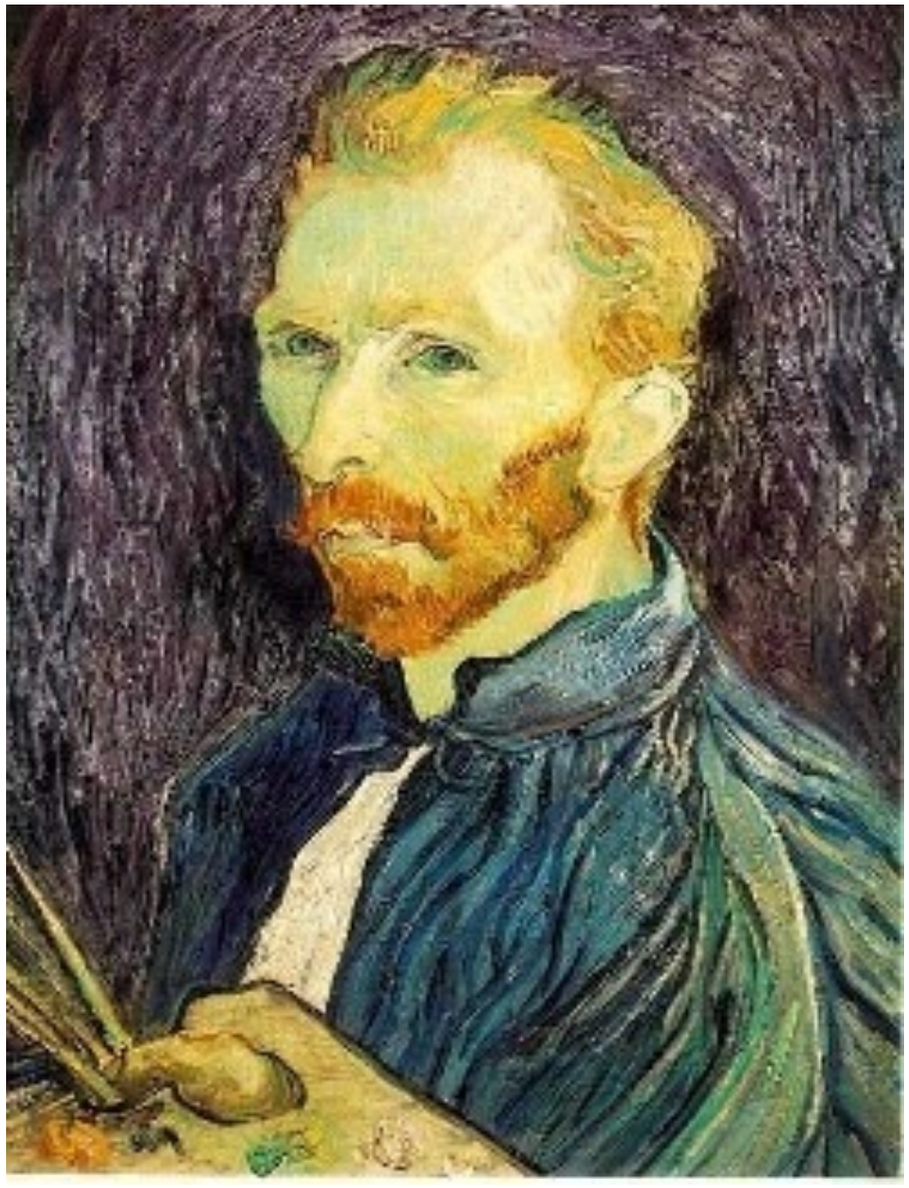
- Filter
- Subsample

Until minimum resolution reached

- can specify desired number of levels (e.g., 3-level pyramid)

The whole pyramid is only 4/3 the size of the original image!

Image sub-sampling



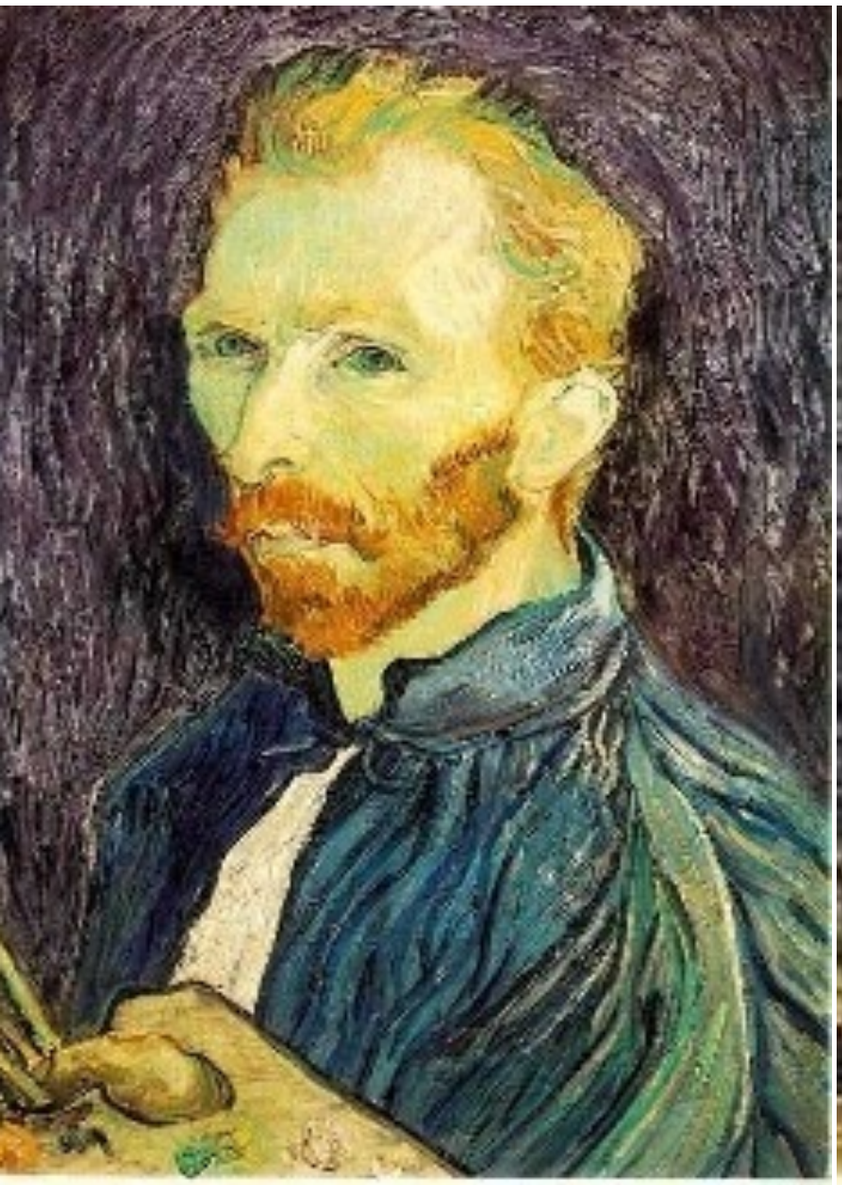
1/4

1/8

Throw away every other row and column to create a 1/2 size image

- called *image sub-sampling*

Image sub-sampling



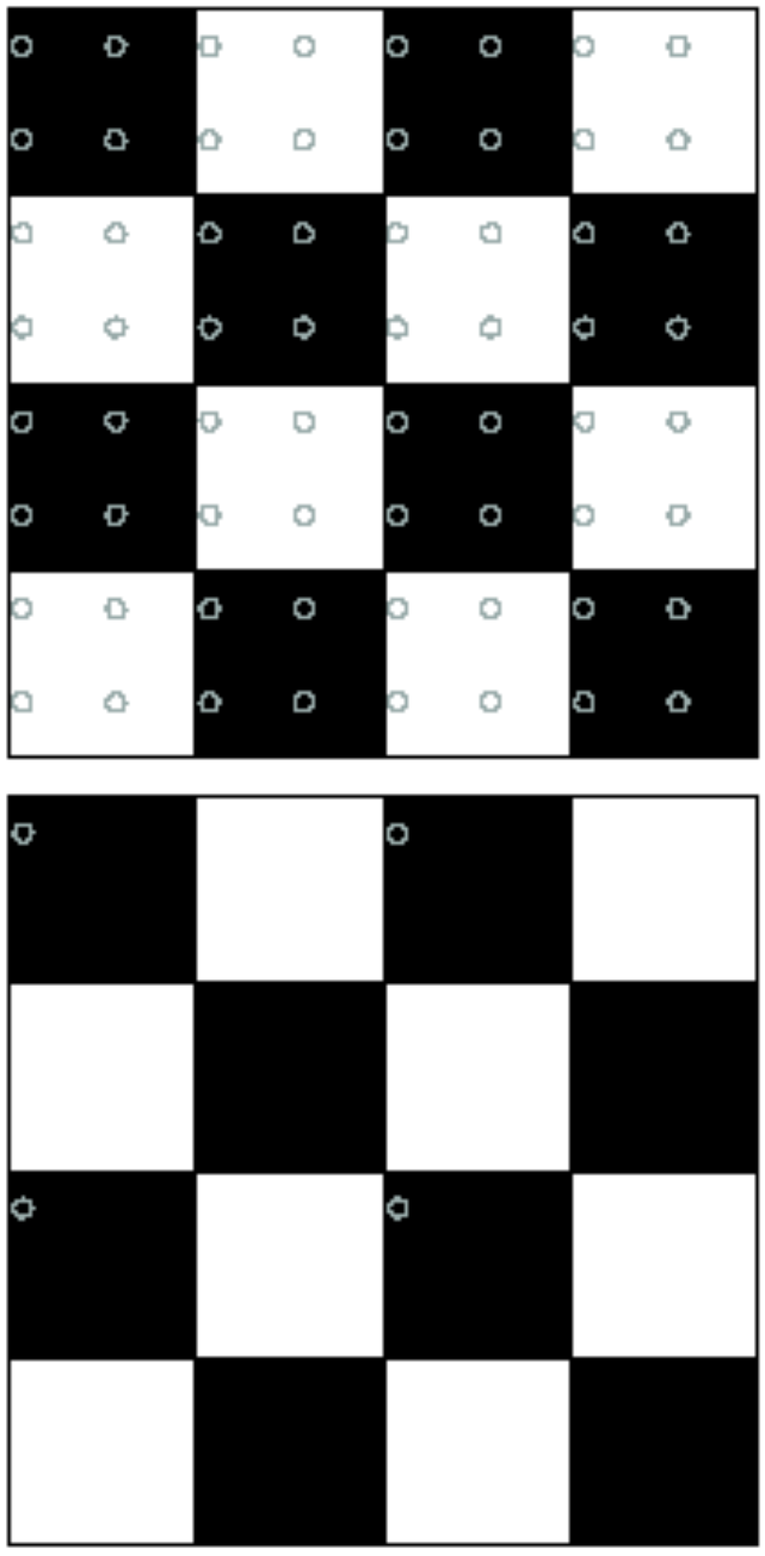
1/2

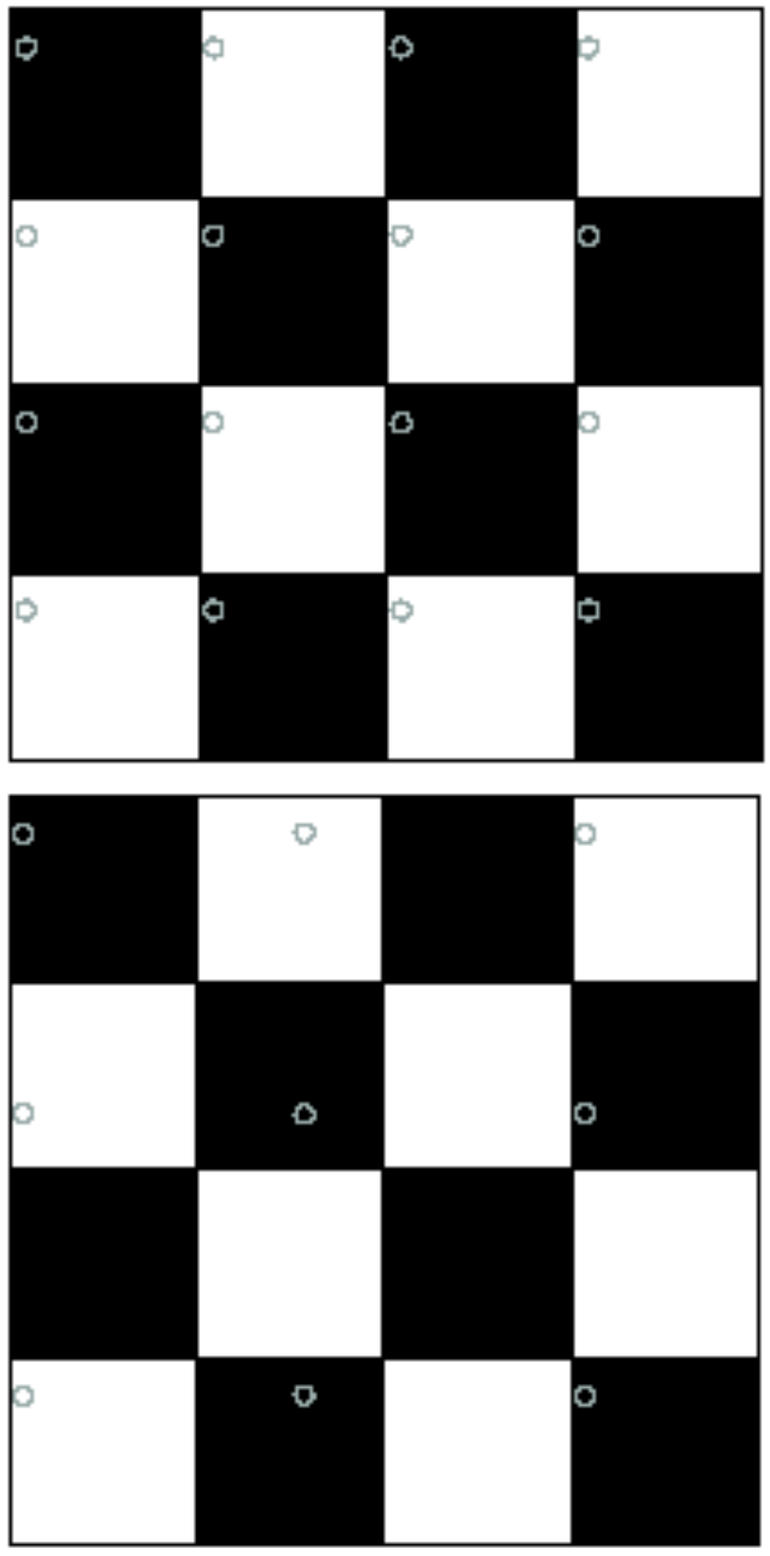
1/4 (2x zoom)

1/8 (4x zoom)

Why does this look so bad?

Sampling





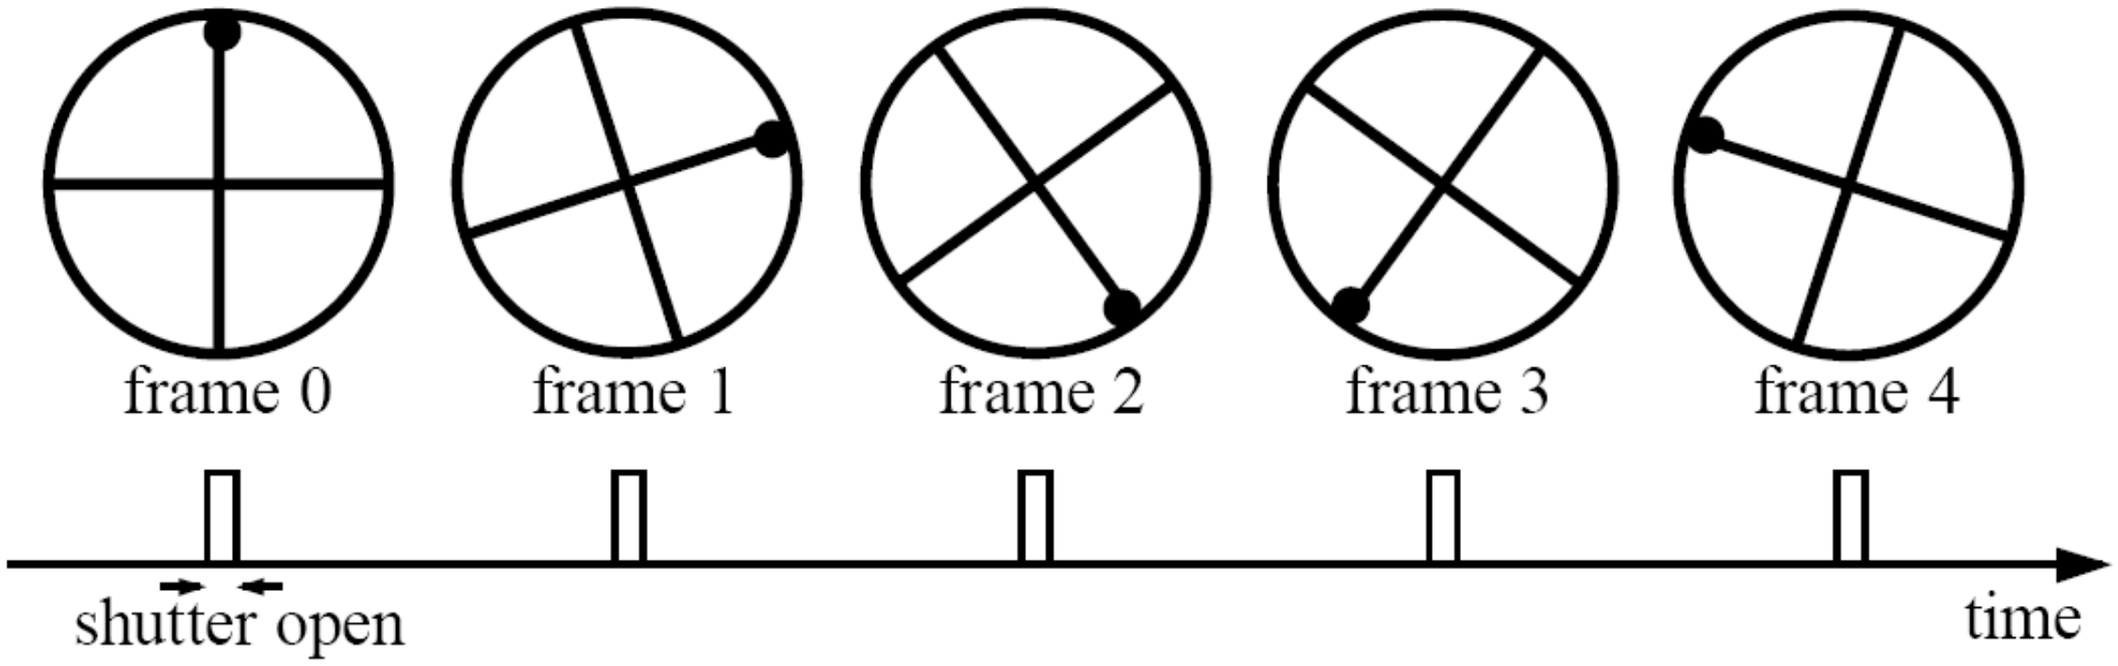
Good sampling:
- Sample often or,
- Sample wisely

Bad sampling:
- see aliasing in action!

Really bad in video

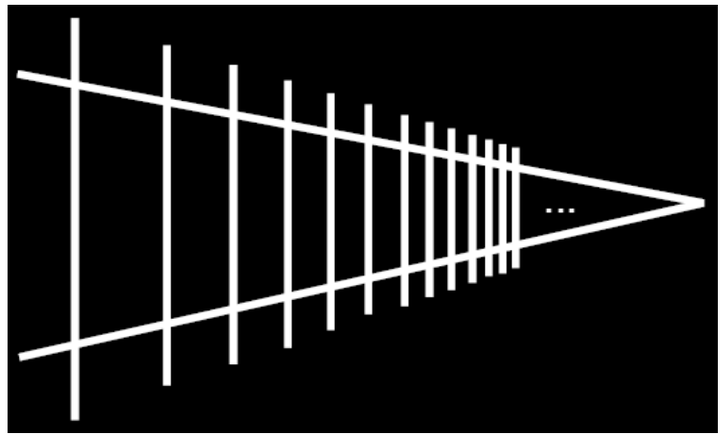
Imagine a spoked wheel moving to the right (rotating clockwise). Mark wheel with dot so we can see what's happening.

If camera shutter is only open for a fraction of a frame time (frame time = 1/30 sec. for video, 1/24 sec. for film):



Without dot, wheel appears to be rotating slowly backwards! (counterclockwise)

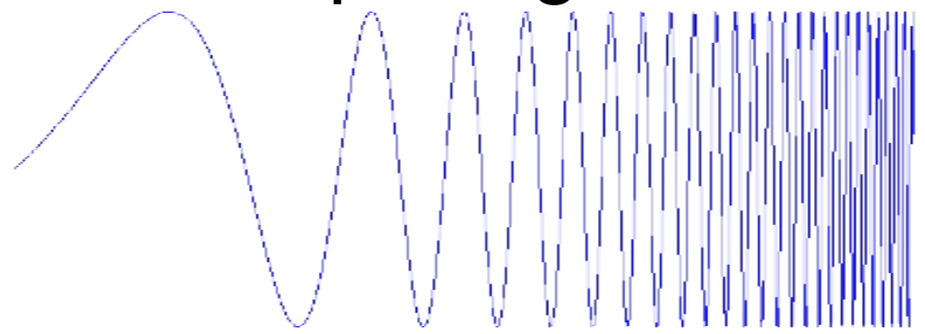
Alias: n., an assumed name



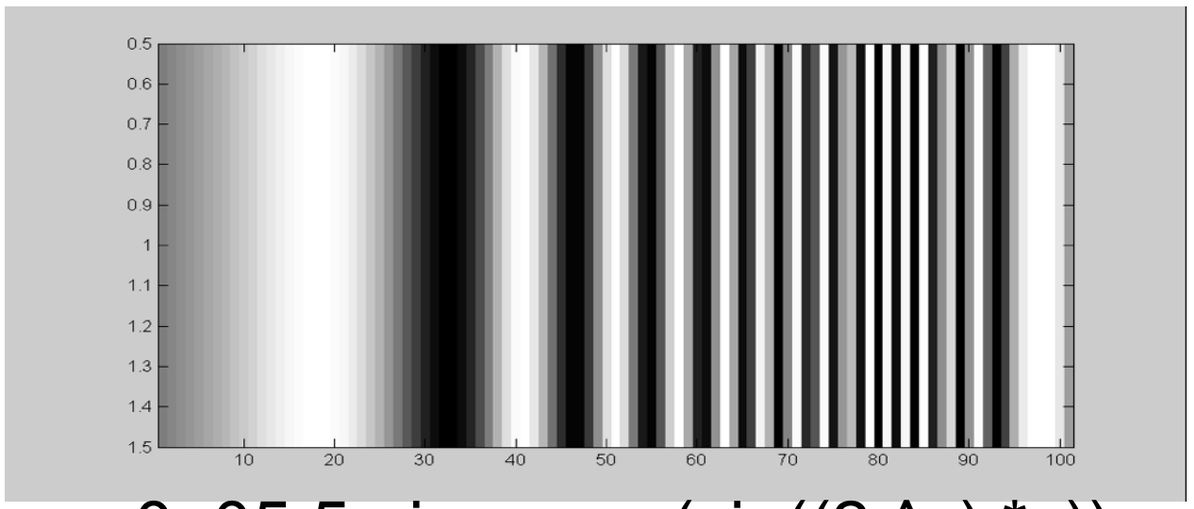
Picket fence receding Into the distance will produce aliasing…

WHY?

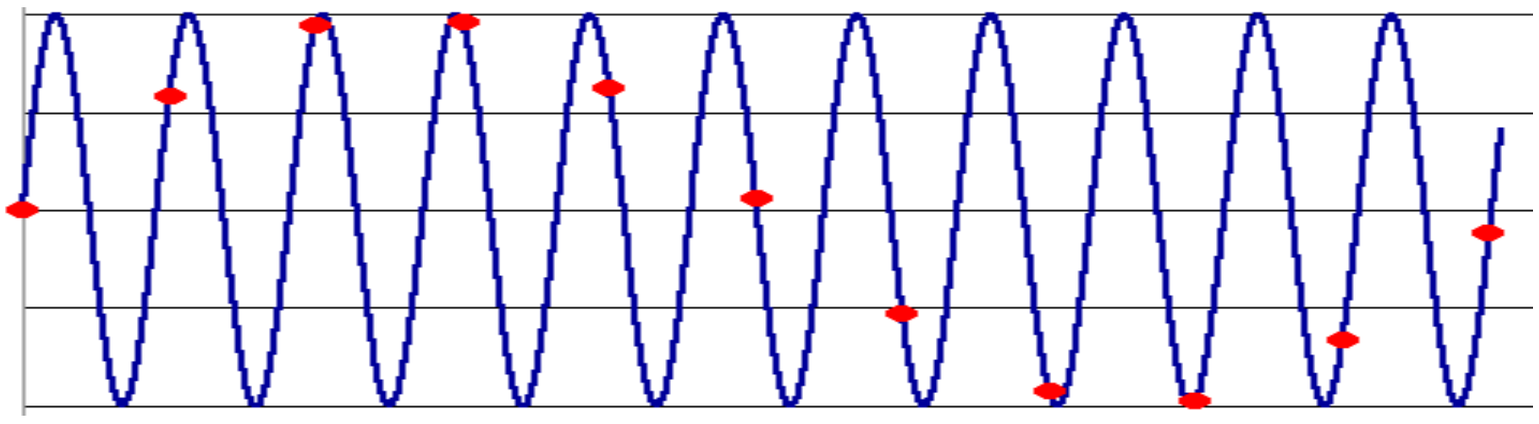
Input signal:



Matlab output:



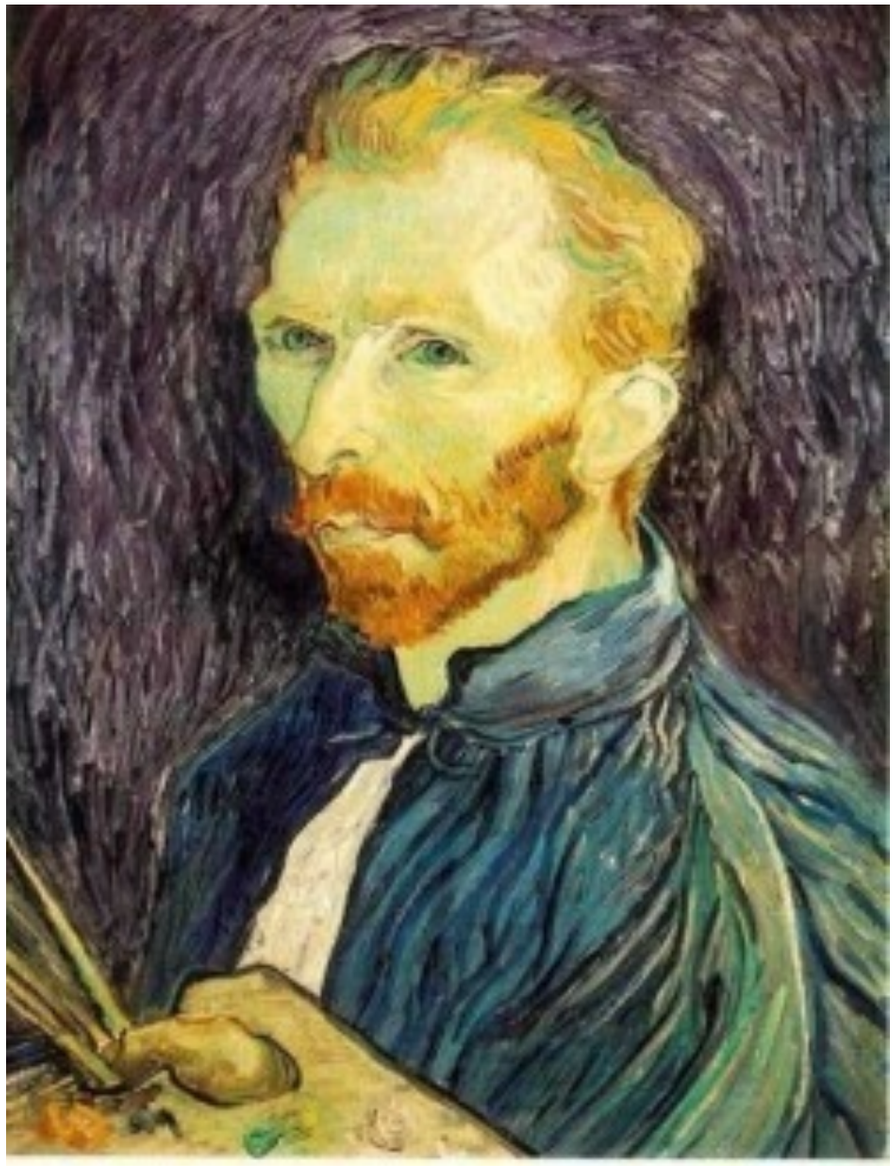
x = 0:.05:5; imagesc(sin((2.^x).*x))



Aj-aj-aj: Alias!

Not enough samples

Gaussian pre-filtering



Gaussian 1/2

G 1/4

G 1/8

Solution: filter the image, *then* subsample

- Filter size should double for each ½ size reduction. Why?

Subsampling with Gaussian pre-filtering

Gaussian 1/2

G 1/4

G 1/8

Solution: filter the image, *then* subsample

- Filter size should double for each ½ size reduction. Why?
- How can we speed this up?

Compare with...

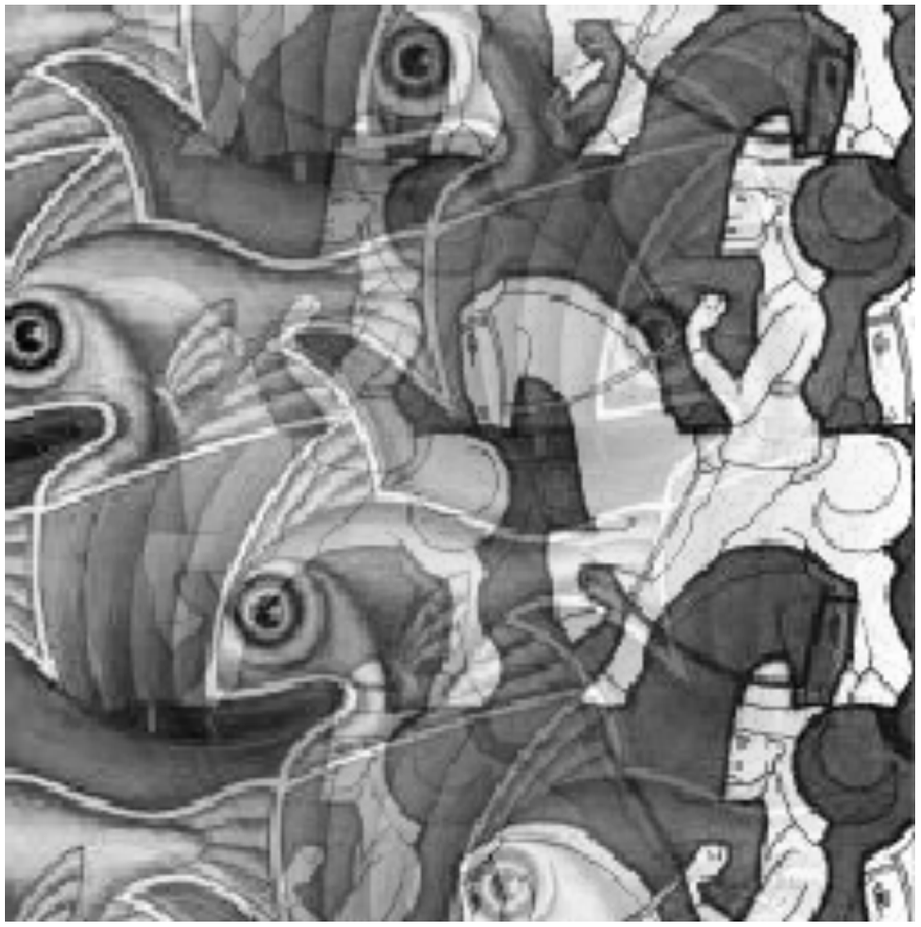
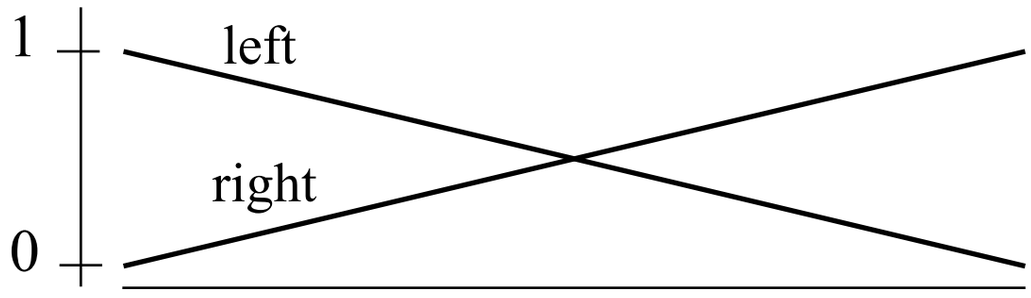
Encoding transparency

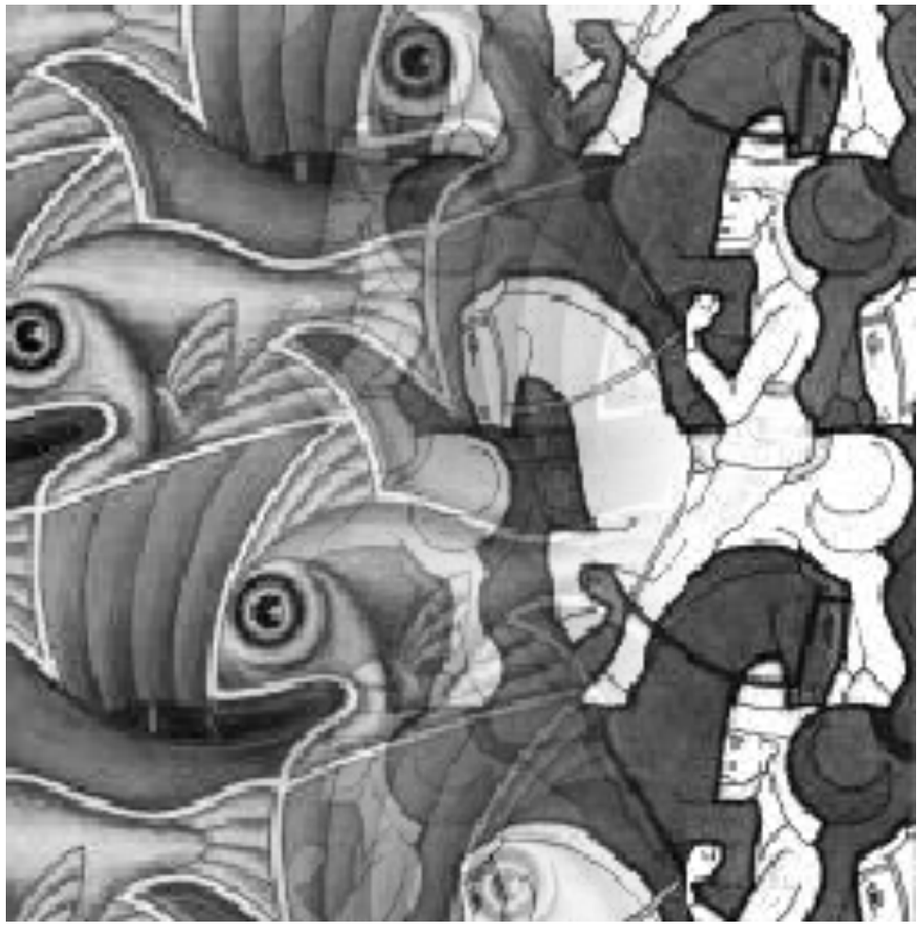
$I(x,y) = (\alpha R, \alpha G, \alpha B, \alpha)$

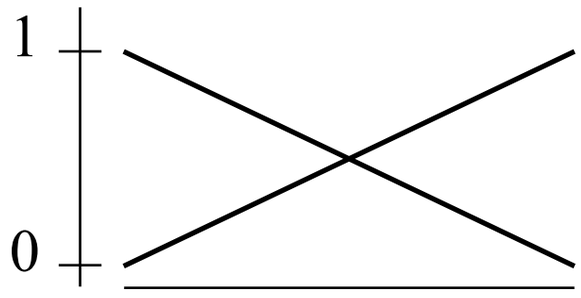
$I_{blend} = I_{left} + I_{right}$

Affect of Window Size

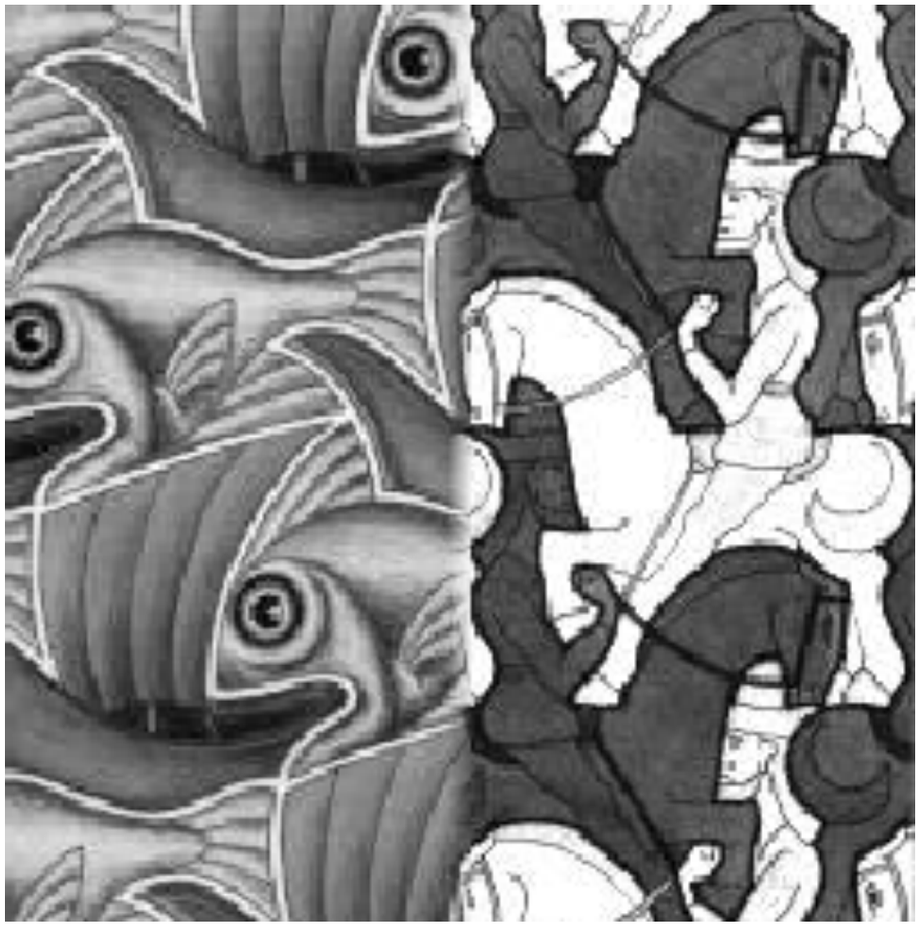


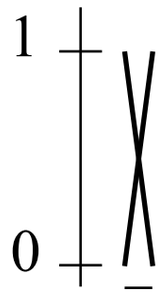


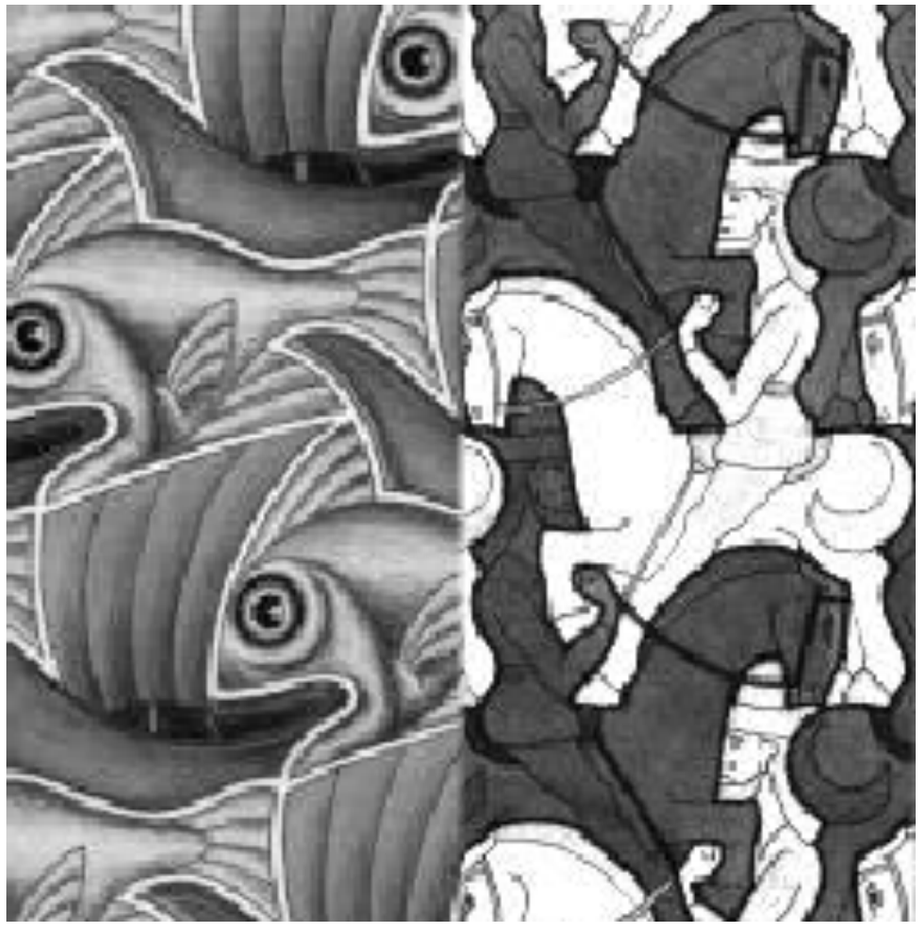


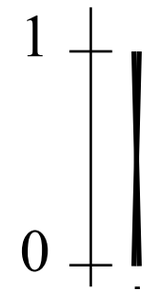


Affect of Window Size

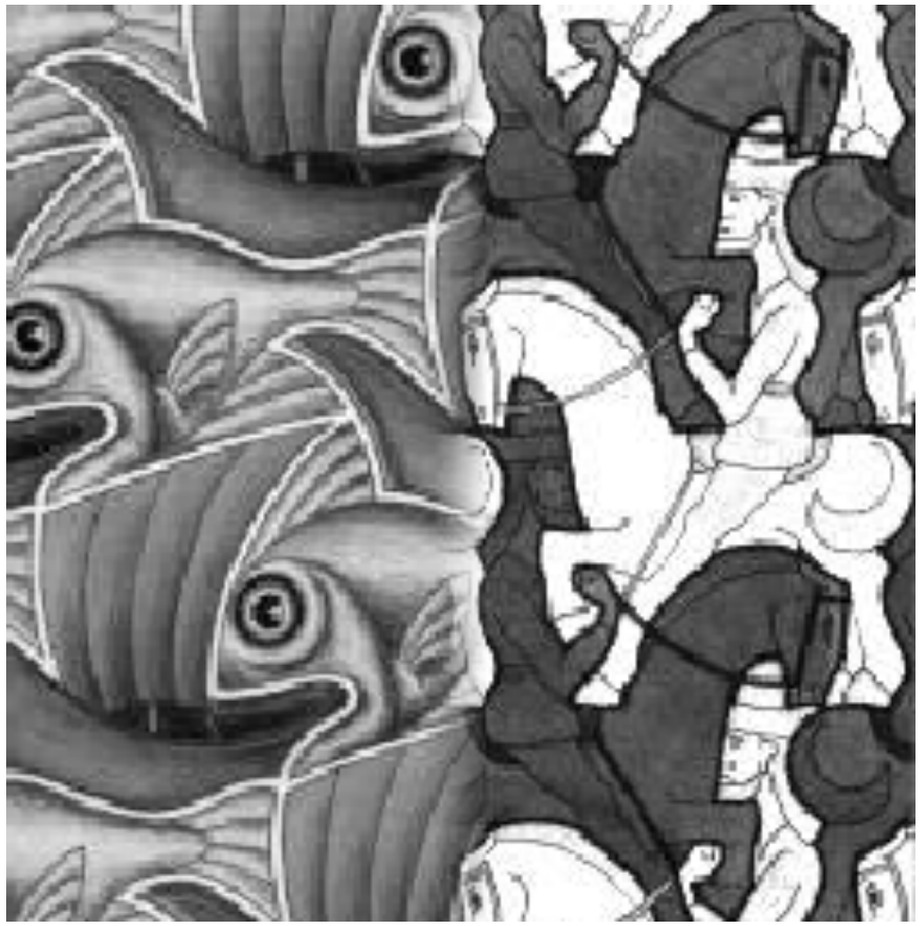


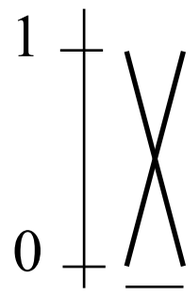






Good Window Size





“Optimal” Window: smooth but not ghosted

What is the Optimal Window?

To avoid seams

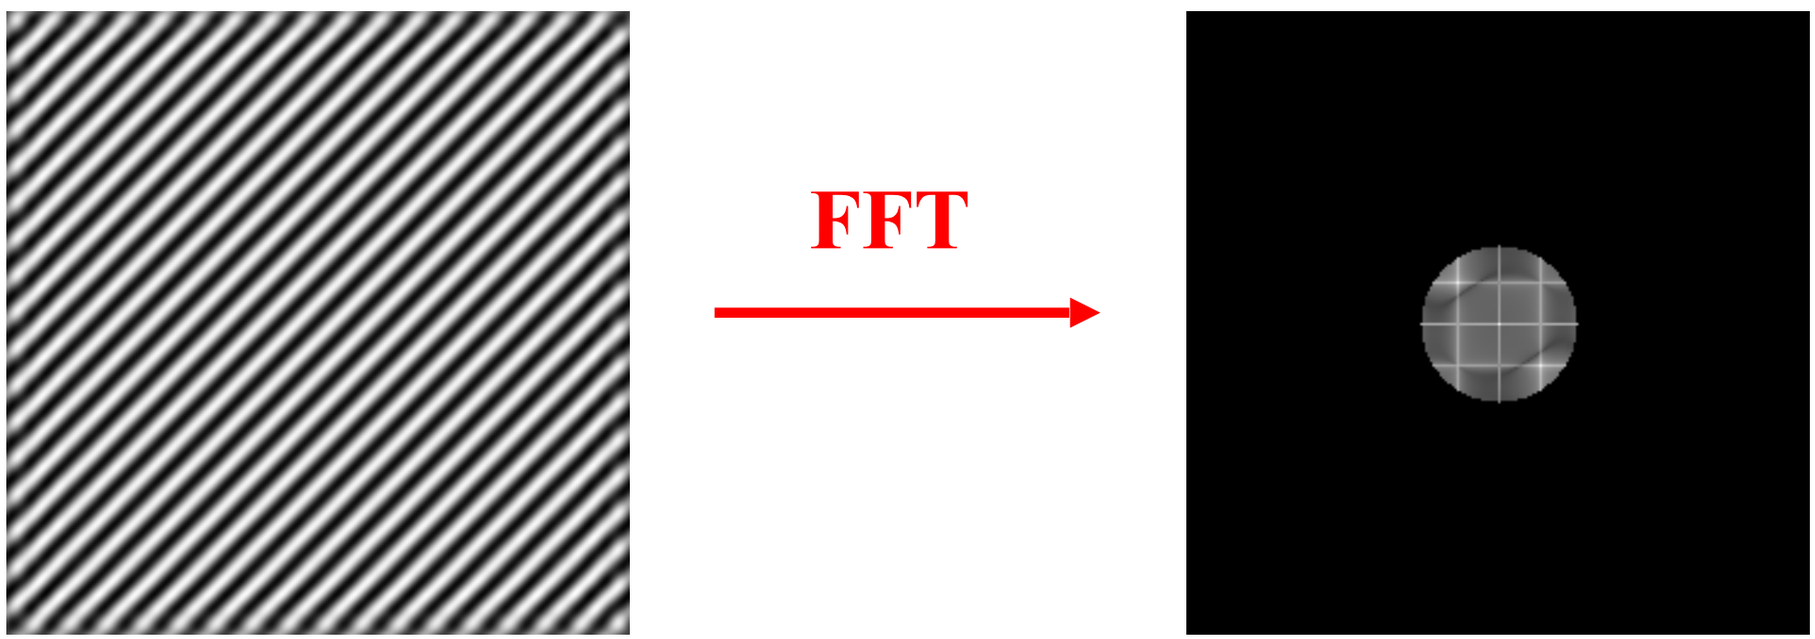
- window >= size of largest prominent feature

To avoid ghosting

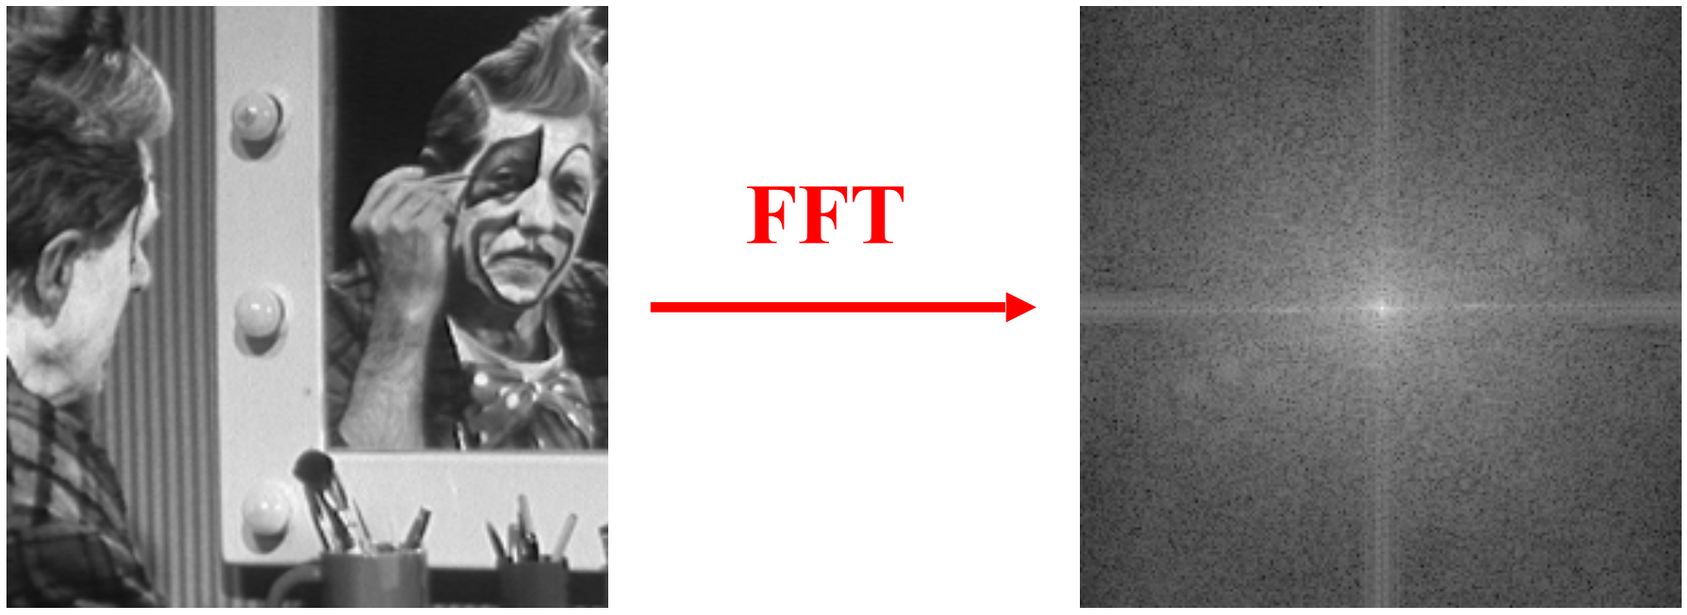
- window <= 2*size of smallest prominent feature

Natural to cast this in the *Fourier domain*

- largest frequency <= 2*size of smallest frequency
- image frequency content should occupy one “octave” (power of two)



What if the Frequency Spread is Wide



Idea (Burt and Adelson)

- Compute $F_{left} = FFT(I_{left})$, $F_{right} = FFT(I_{right})$
- Decompose Fourier image into octaves (bands)
  - $F_{left} = F_{left}^1 + F_{left}^2 + \ldots$
- Feather corresponding octaves F_{left}^i with F_{right}^i
  - Can compute inverse FFT and feather in spatial domain
- Sum feathered octave images in frequency domain

Better implemented in *spatial domain*

What does blurring take away?

original

What does blurring take away?

smoothed (5x5 Gaussian)

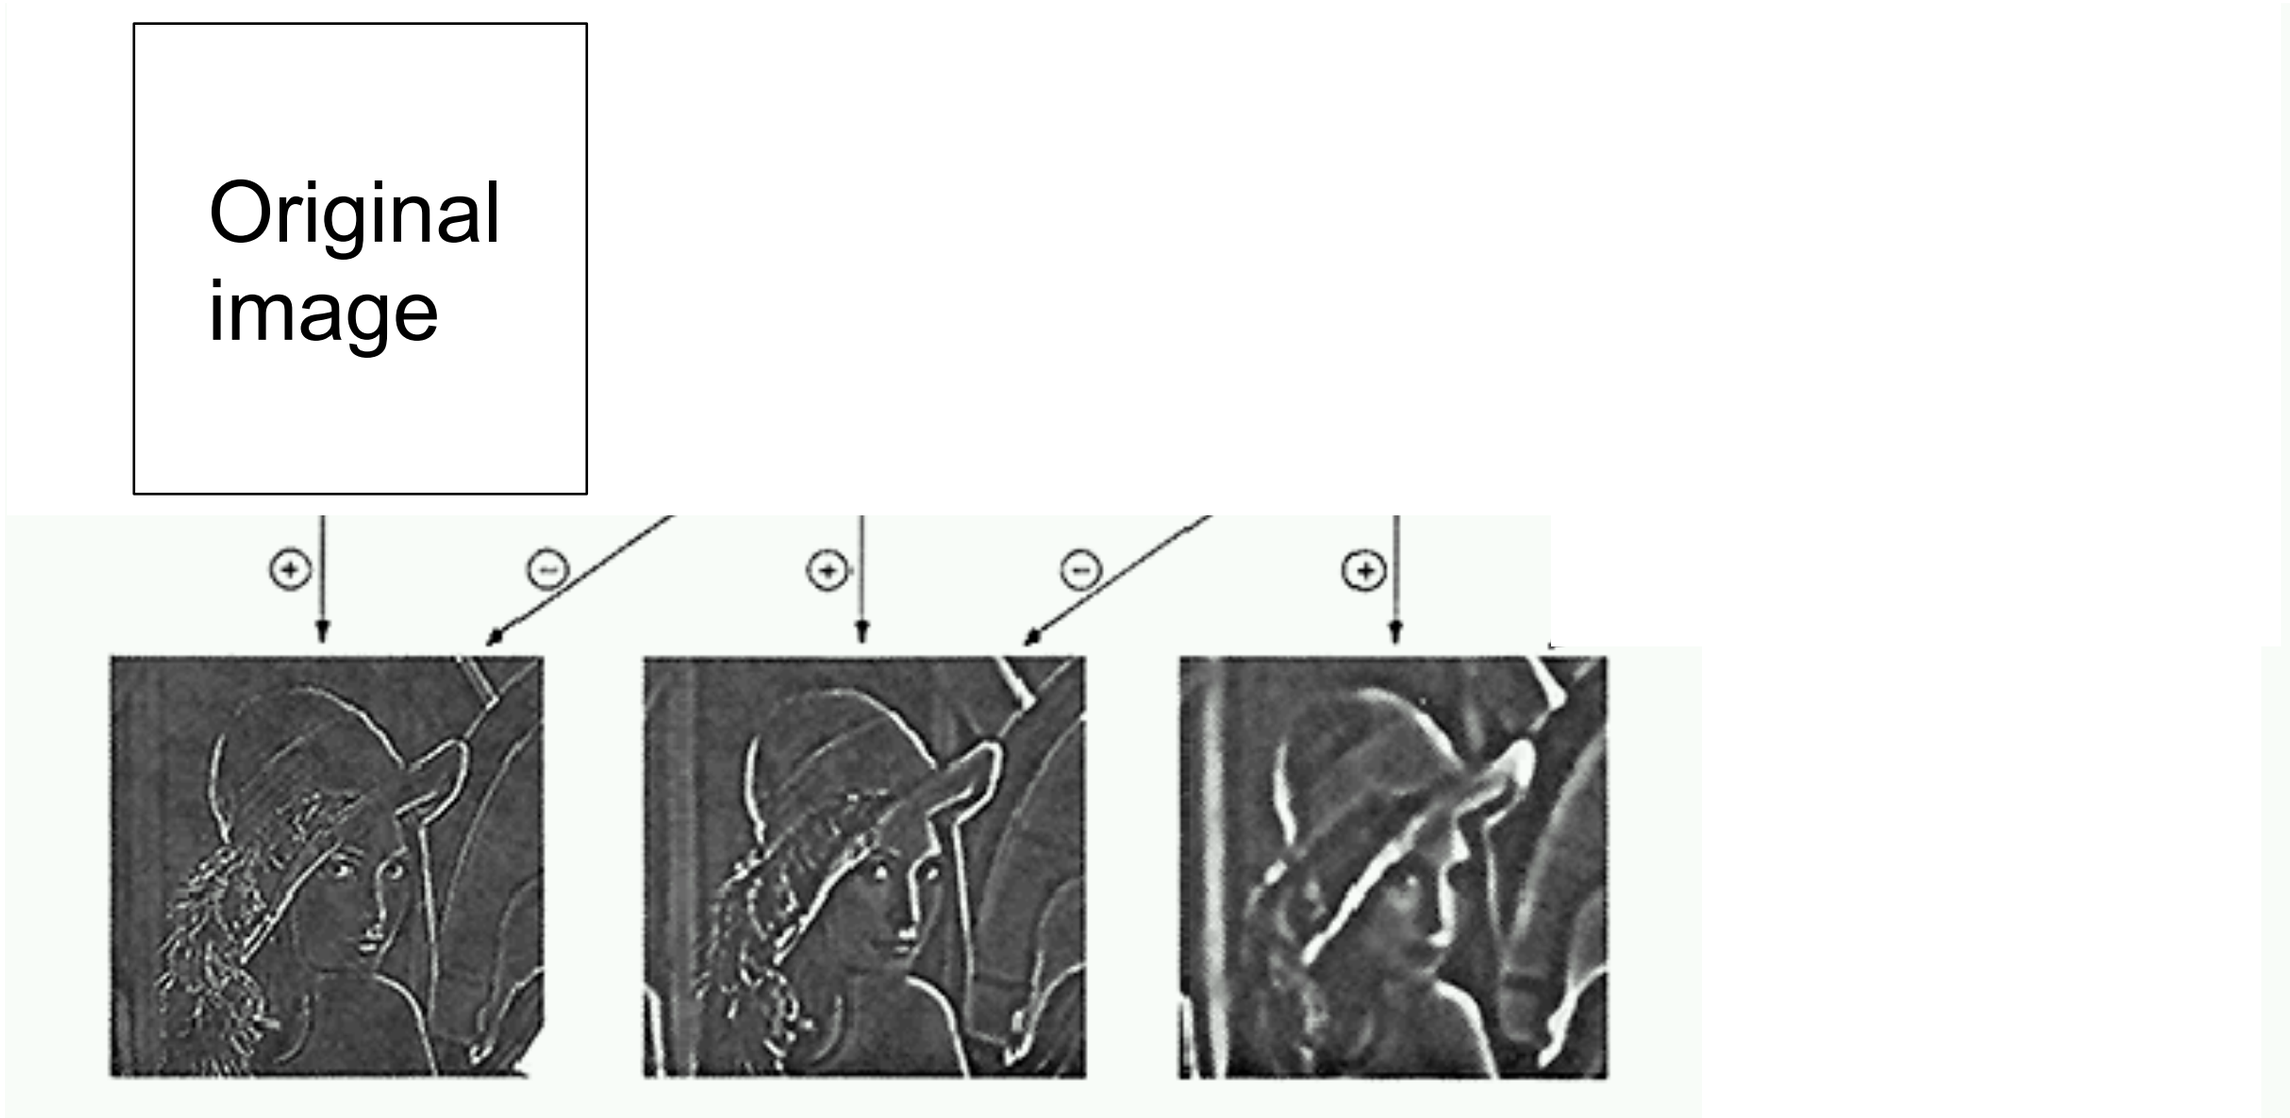
High-Pass filter

smoothed – original

Band-pass filtering

Gaussian Pyramid (low-pass images)

Laplacian Pyramid



How can we reconstruct (collapse) this pyramid into the original image?

blended pyramid

Laplacian Pyramid: Blending

General Approach:

1. Build Laplacian pyramids *LA* and *LB* from images *A* and *B*
2. Build a Gaussian pyramid *GR* from selected region *R*
3. Form a combined pyramid *LS* from *LA* and *LB* using nodes of *GR* as weights:
   - *LS(i,j) = GR(I,j,)*LA(I,j) + (1-GR(I,j))*LB(I,j)*
4. Collapse the *LS* pyramid to get the final blended image

Blending Regions

Season Blending (St. Petersburg)

Season Blending (St. Petersburg)

Simplification: Two-band Blending

Brown & Lowe, 2003

- Only use two bands: high freq. and low freq.
- Blends low freq. smoothly
- Blend high freq. with no smoothing: use binary mask

2-band Blending

Low frequency (λ > 2 pixels)

High frequency (λ < 2 pixels)

Linear Blending

2-band Blending

Gradient Domain

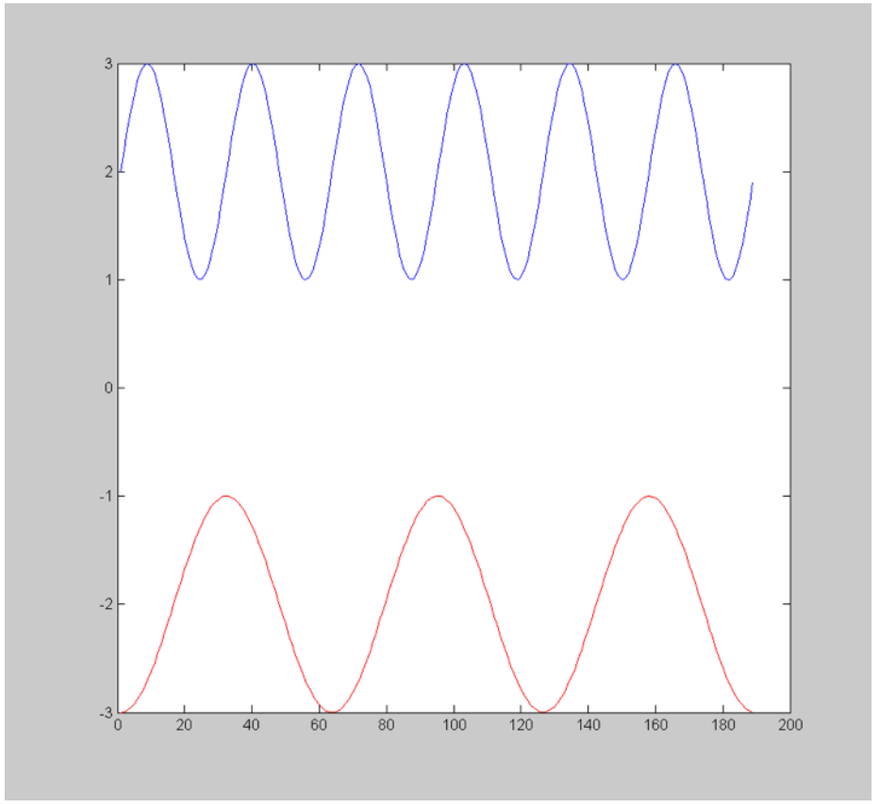
In Pyramid Blending, we decomposed our image into 2^{nd} derivatives (Laplacian) and a low-res image

Let us now look at 1^{st} derivatives (gradients):

- No need for low-res image
  - captures everything (up to a constant)
- Idea:
  - Differentiate
  - Blend
  - Reintegrate

Gradient Domain blending (1D)

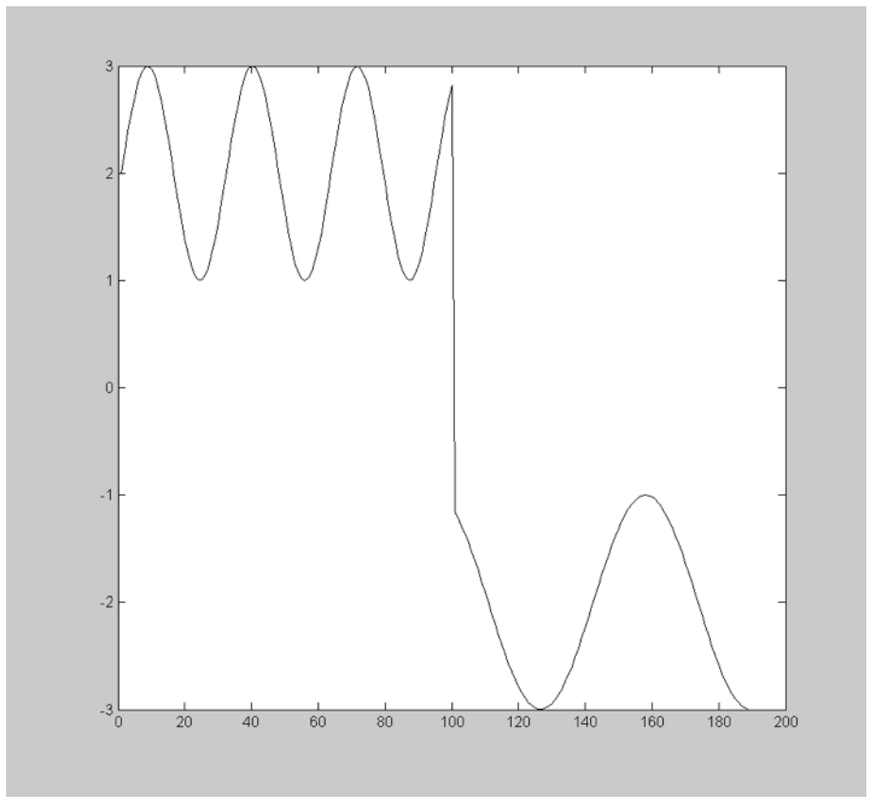
Two signals

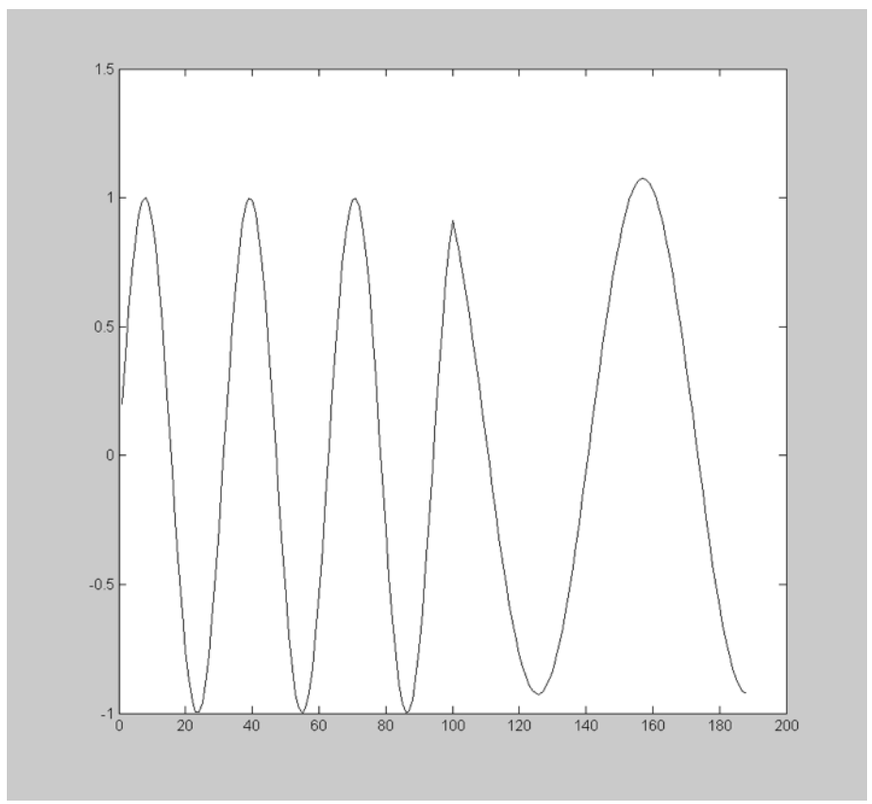


bright

dark

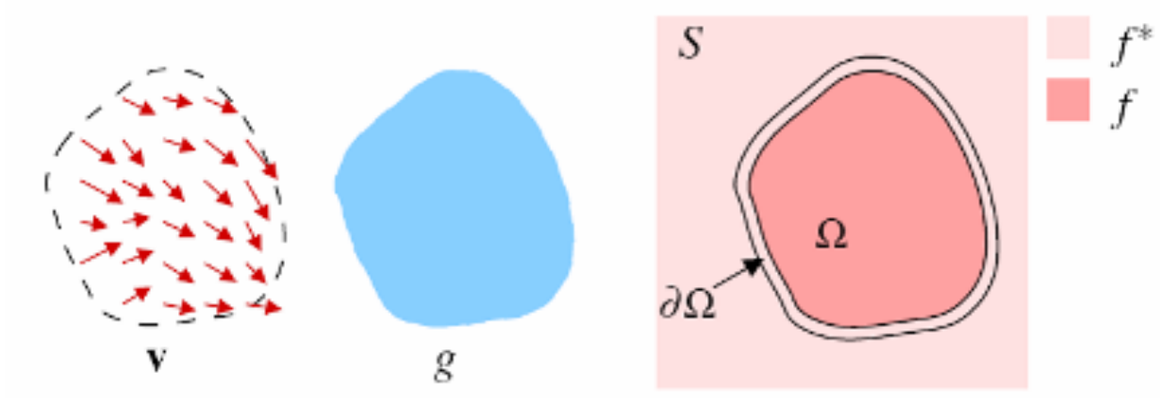
Regular blending





Blending derivatives

Gradient Domain Blending (2D)



Trickier in 2D:

- Take partial derivatives dx and dy (the gradient field)
- Fidle around with them (smooth, blend, feather, etc)
- Reintegrate
  - But now integral(dx) might not equal integral(dy)
- Find the most agreeable solution
  - Equivalent to solving Poisson equation
  - Can use FFT, deconvolution, multigrid solvers, etc.

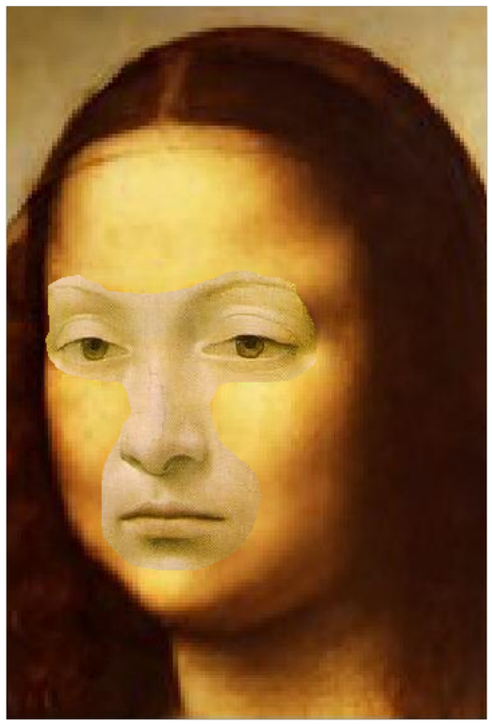
source/destination



cloning

seamless cloning

editing

Limitations:

- Can’t do contrast reversal (gray on black -> gray on white)
- Colored backgrounds “bleed through”
- Images need to be very well aligned

Don’t blend, CUT!

Moving objects become ghosts

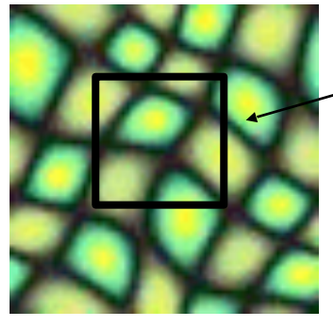
So far we only tried to blend between two images.
What about finding an optimal seam?

Davis, 1998

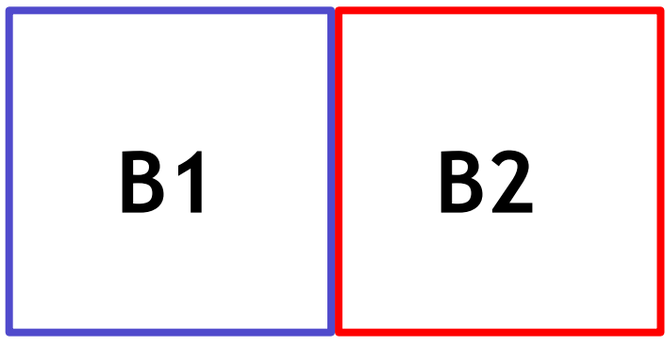
Segment the mosaic

- Single source image per segment
- Avoid artifacts along boundries
  - Dijkstra's algorithm

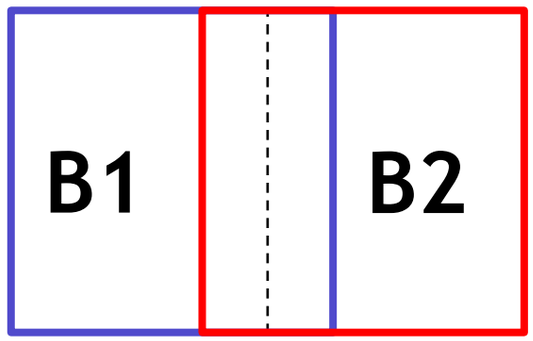
Efros & Freeman, 2001



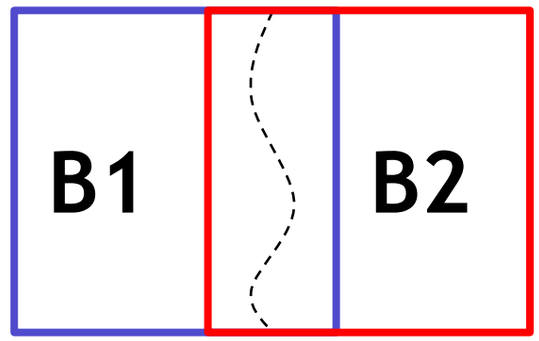
Input texture



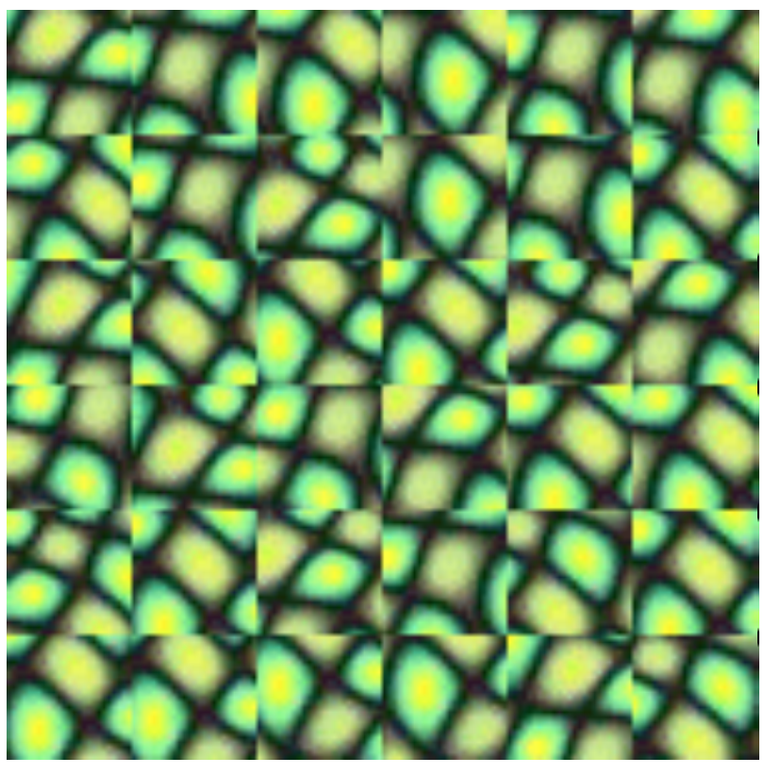
Random placement of blocks

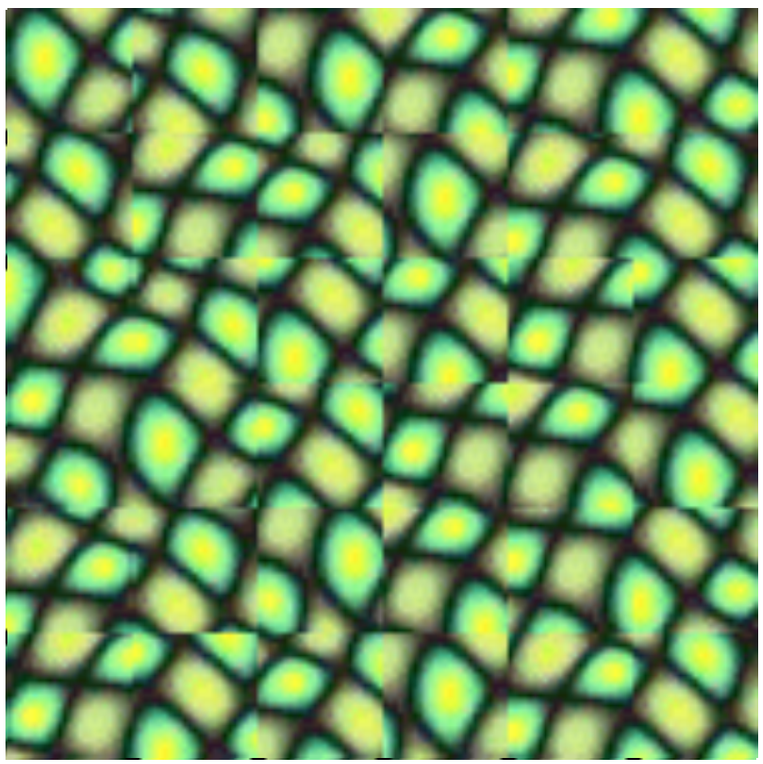


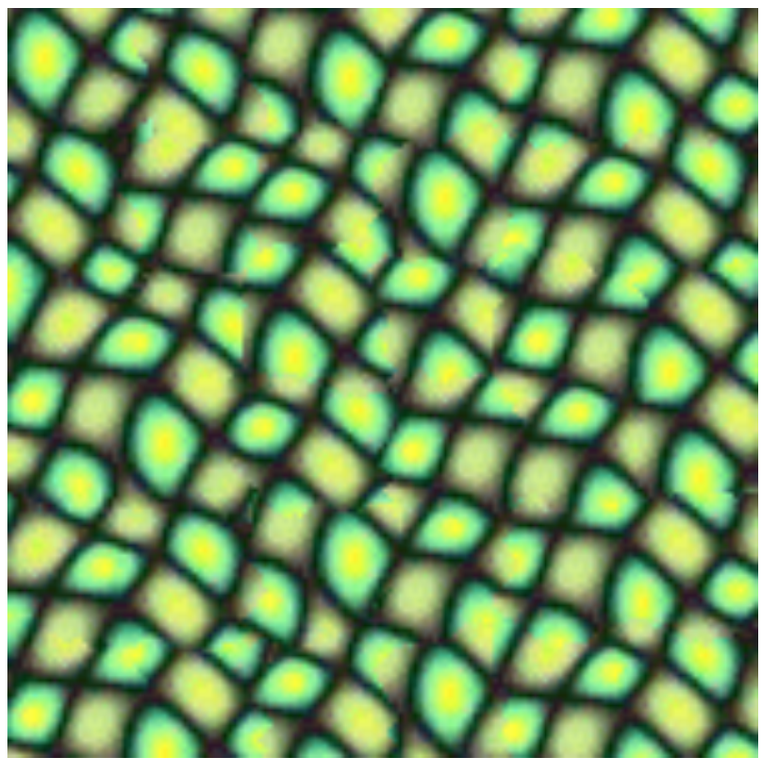
Neighboring blocks constrained by overlap



Minimal error boundary cut

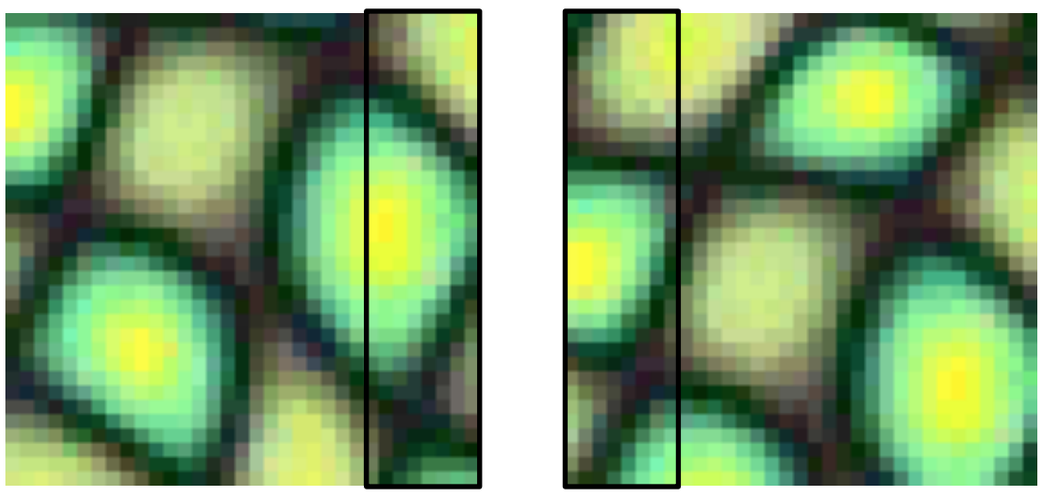




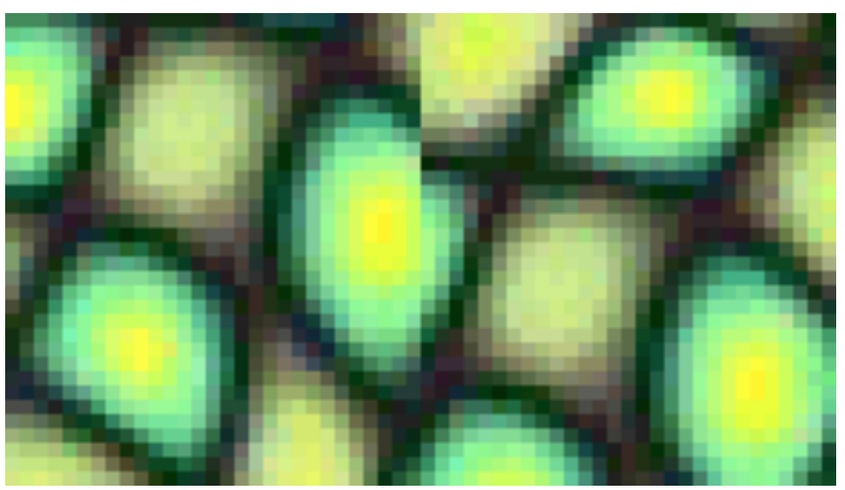


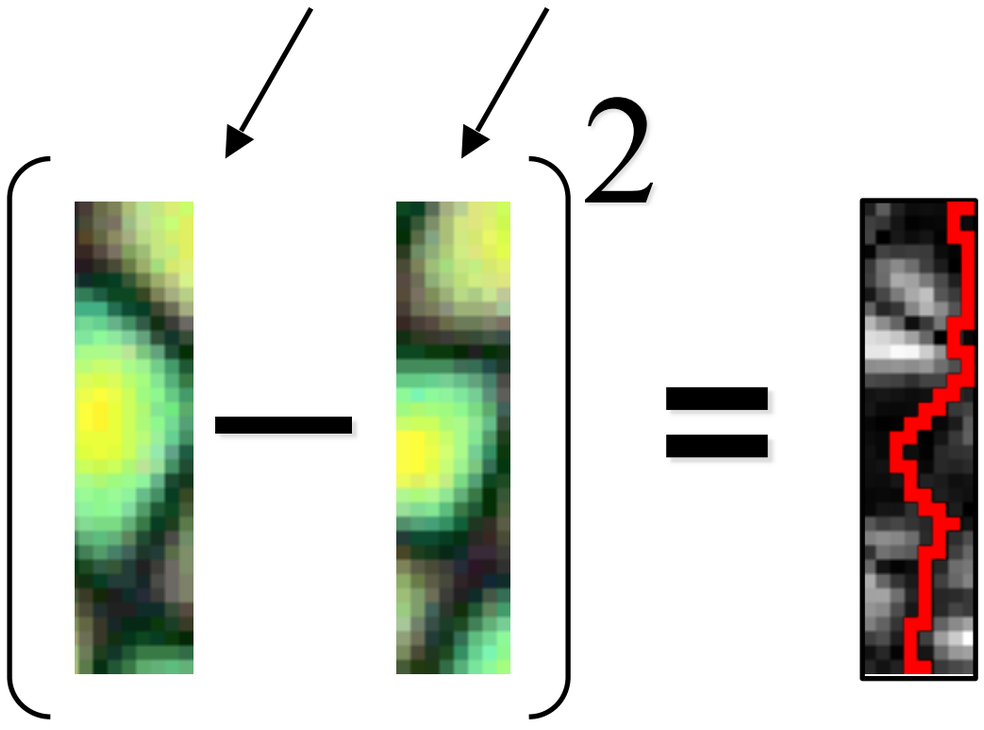
Minimal error boundary

overlapping blocks

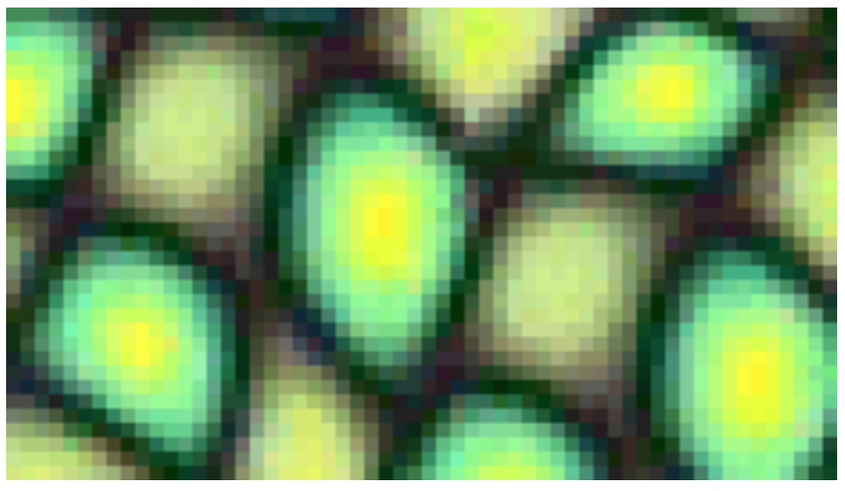


vertical boundary





overlap error



min. error boundary

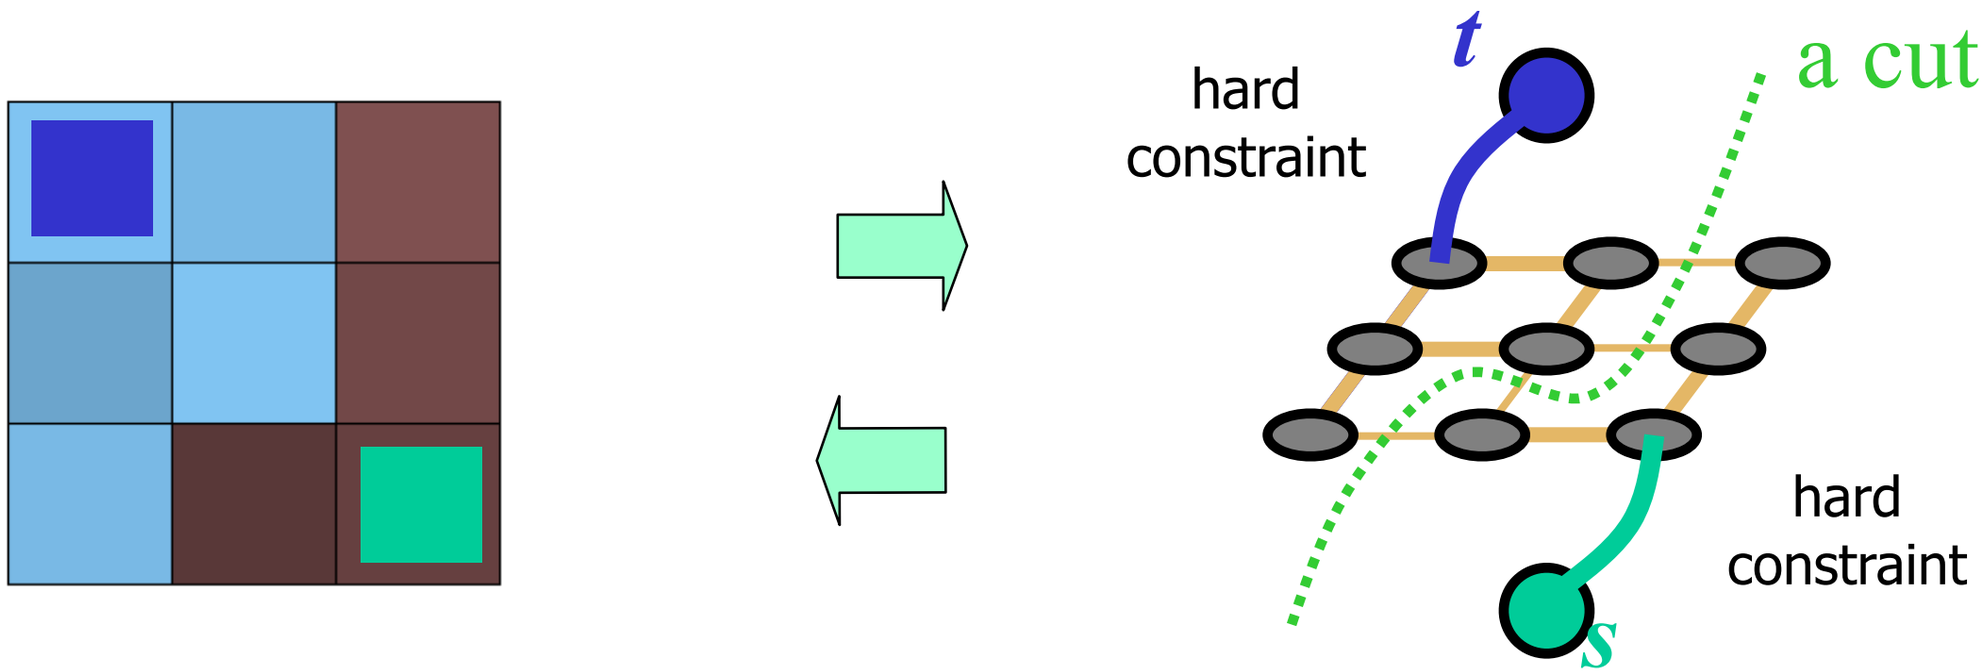
Graphcuts

What if we want similar “cut-where-things-agree” idea, but for closed regions?

- Dynamic programming can’t handle loops

Graph cuts

(simple example à la Boykov&Jolly, ICCV'01)



Minimum cost cut can be computed in polynomial time

(max-flow/min-cut algorithms)

Kwatra et al, 2003

Actually, for this example, DP will work just as well…

Putting it all together

Compositing images

- Have a clever blending function
  - Feathering
  - blend different frequencies differently
  - Gradient based blending
- Choose the right pixels from each image
  - Dynamic programming – optimal seams
  - Graph-cuts
